Web Production

For my final assignment, I want to create an extension of my midterm assignment and create a full-on scam shop page. Referencing old 2000s websites I want to keep an aesthetic that is synonymous with that style but with modern touches in interactivity.

Some websites that do a good job in this are www.msCHF.com, www.awge.com, www.blade.industries, and www.pglang.com.

I plan to incorporate everything from a home page, a product page, and even a checkout page. I also want to incorporate more details into the pages I already have, such as small icons and descriptions of items. I want to include a search bar to search for the products you want and make the website very intuitive. I also want to include strange interactive elements that wouldn't make sense such as a logo that is moveable, or even an item you can take out of the picture and drag to other parts of the site.

My main goal with the website is to have a functional shop page, with random elements of interactivity that add to the strangeness of the website. Keeping true to the aesthetic I also want to make sure each element makes sense in the overall aesthetic of the website. I think the hardest elements will be the random interactive features, as I want to include them without breaking the entirety of my code.
